

Beat the Heat

It's hot! Summer sunshine brings hot temperatures to many places. Some people love the heat. It's great for people who love to go boating or swimming. The heat is great for those who just love to sit in the shade with some cold lemonade.

For many people, however, hot weather causes a lot of problems. In the last few years, many records have been set for hot temperatures. In places like northern Europe and Russia, hot weather is rare. People who live there are often not ready to deal with the heat when it happens.

It's Cooler in the Shade

How hot it gets outside depends on many things.

Latitude and altitude are two things that make a big difference in how hot a place gets.

Latitude describes how far north or south a place is. The equator is the line around the middle of the Earth. This area gets the most direct sunlight. Temperatures in those areas tend to be higher. Temperatures get colder as you move north toward the North Pole or south toward the South Pole. These places get much less direct sunlight. They get less heat.

Altitude describes how high a location is compared to sea level. Temperatures tend to be hottest

closest to sea level. Temperatures get cooler up mountains. It is possible to have summer temperatures in the 80's and 90's in a valley. And there may still be snow on the mountain tops nearby. Ecuador is a country in South America. The equator runs right through. In Ecuador, there are mountains so tall that they have glaciers on top all year long. But the lower areas of the country are hot tropical forest.

Cities are hotter than the country. This is because of the concrete and roads in the city. They absorb the sun's heat during the day and hold on to it. It is harder for the area to cool down during the night. Phoenix is a large city in a desert. Temperatures in the summer don't drop below 90° even at night.

Areas with a lot of trees and green plants can be as much as 5-14 degrees cooler. Shade makes a big difference. People are looking for ways to add more shade to city streets. They want to plant more trees. If there's not room for a tree, a canopy on the side of the building or over the sidewalk can help.

Weather Extremes

The hottest temperature on Earth was 136° on September 13, 1922 in Libya, a desert country in northern Africa. In the United States, Death Valley in California is hottest. The hottest temperature there was 134° on July 10, 1913. Death Valley has the hottest summer temperatures in the Western Hemisphere. The temperature overnight in the summer can be over 100°. It is the only place in the U.S. where it stays that hot.

The average summer temperature in Death Valley is also the highest in the country at 92.8°. The highest average temperature in the winter is in Honolulu, Hawaii. The average temperature there is 72.8°. Hawaii is the most southern state. It is warm year-round. Ocean breezes keep it from being too hot, however. The highest record temperature in Hawaii

is 100° - the same as the highest recorded temperature in Alaska.

Humans are most comfortable in temperatures between 68° and 80°. As it gets hotter, the heart has to work harder. People begin to feel tired and grouchy. It gets harder to concentrate. The body sweats to cool itself down.

95° and 104° is the hottest that humans can deal with easily. Loss of the body's water due to sweating can lead to heat exhaustion. It can cause muscle cramping. Dizziness and fainting may happen. Heat rash and swelling are also common. This happens more for people who are not used to being so hot.

Heat stroke is the most serious heat-related illness. The body temperature rises above 105°. The person stops sweating. The victim may faint. Medical help is needed right away. Without help, the victim may suffer damage to the brain, kidneys and heart. Heat stroke can be fatal. Young children and old people are most at risk. People who are sick a lot may be at risk too.

Between 1999-2003 in the United States, 3,442 people died from the heat. The most deaths happened in Arizona and Nevada. 40% of those who died from the heat were older than 65. 7% (about 200 people) were under the age of 15.

How to Beat the Heat

Not many people lived in the American southwest. Then inventions like air conditioners made it more comfortable to live in the desert heat. Electric fans and air conditioning are great ways to stay cool and healthy in the hottest times of the year. Here are other ways to keep cool:

- Spend time outside in the mornings. You may have outside chores to do. You may have to mow the lawn. You may have to weed the garden. Get outdoor activities done during the coolest part of the day.

- Use the shade. Plant trees around your house. Shade from the trees keeps the walls and roof from heating up. Keep window shades and curtains closed. Less heat will come into your house.

- Drink water or energy drinks with electrolytes. Drink all day to keep your body hydrated. Limit sugary drinks. Limit drinks with caffeine.

- At night, turn the fan around so that it blows air out the window. This will force out the heated air that is trapped in your house during the day.

- Limit use of electronics. Items such as computers, TVs, and stereos create heat. Keeping them turned off can lower the temperature in a room by a degree or two.
